**Washington, DC, May 15, 2012**

# Outline

- Commitment to Equity Project: Background
- Standard Incidence Analysis: Methodological Highlights
- How much redistribution LA achieves through fiscal policy? How effective are governments at redistribution?

# Commitment to Equity Project

- Commitment to Equity (CEQ) Project; Inter-American Dialogue and Tulane University's CIPR and Dept. of Economics.
- Currently: 12 countries
- 6 finished: Argentina (2009), Bolivia (2007), Brazil (2009), Mexico (2008), Peru (2009) and Uruguay (2009) (year of HH survey)
- 6 in progress: Chile, Colombia, Costa Rica, El Salvador, Guatemala, Paraguay
- To begin soon: Dominican Republic
- Branching out into other regions

# Commitment to Equity Project

- Argentina: Carola Pessino (CGD and CEMA)
- Bolivia: George Gray Molina (UNDP), Wilson Jimenez, Veronica Paz and Ernesto Yañez (Instituto Alternativo, La Paz,
- Brazil: Claudiney Pereira and Sean Higgins (Tulane)
- Mexico: John Scott (CIDE and CONEVAL)
- Peru: Miguel Jaramillo (GRADE)
- Uruguay: Marisa Bucheli, Maximo Rossi, and Florencia Amabile (Universidad de la Republica)

# Basic elements of incidence analysis

Start with:

- Pre-tax/pre-transfer income of unit  $h$ , or  $I_h$
- Taxes/transfers programs  $T_i$
- “Allocators” of program  $i$  to unit  $h$ , or  $S_{ih}$  (or the share of program  $i$  borne by unit  $h$ )

Then, post-tax/post-transfer income of unit  $h$  ( $Y_h$ ) is:

$$Y_h = I_h - \sum_i T_i S_{ih}$$

All of this seems easy, and answers the key question:

*Who pays the taxes or gets the transfers?*

# **Methodological Highlights**

# **There are lots of questions that must be answered.**

- What is the “unit” (e.g., individual versus household)?
- What is “income”?
  - Comprehensive income?
  - Annual versus lifetime measure?
  - Market and non-market measure (including tax evasion)?
- How are components of income measured (e.g., capital income)?
- Should “consumption” be used instead of “income”?
- What is the time frame of analysis (e.g., annual versus lifetime)?
- What taxes and transfers are included?
- What are the allocators?
- What happens when individuals change “ranks”?
- How can the results be easily summarized?

# Methods to Allocate Taxes and Transfers

- Direct Identification Method
- Inference Method
- Simulation Method
- Imputation Method
- Alternate Survey
- Secondary Sources Method

# Some additional considerations...

- Analyzing one part of the tax/transfer system in isolation of another can give misleading results
- Analyzing the effects of taxes/transfers at the “top” and at the “bottom” is especially difficult
- State and municipal taxes
- How to scale-up
- How to rank
- Implications of re-ranking

# Definitions: Effectiveness Indicator

Example: Gini net mkt income & Gini Disposable income

- Numerator:  $\text{Gini (net mkt inc)} - \text{Gini(disp inc)}/\text{Gini(net mkt inc)}$
- Denominator: Gov. Spending on Direct Transfers/GDP

# Defining Progressive and Regressive Taxes and Transfers

# **CEQ Project: Defining and Constructing Welfare Indicator**

# Fiscal Incidence: Welfare Indicator

Current Income per capita

- No adjustment for age, gender or economies of scale
- No adjustment for under-reporting
- Several household surveys in LA only have income data; so, if one wants to compare across countries, income data must be used in all, even in those in which there is data on consumption. But, for the latter, ideally one should do both.

# Taxes and Transfers Included

## Taxes

- Personal Income Tax
- Contributions to Social Security (Payroll Taxes)
- Indirect Taxes (mainly VAT)

## Transfers

- Direct Cash Transfers
- Food Transfers
- Indirect Subsidies
- Transfers in-kind through public education and health

# Fiscal Incidence Indicators

- Changes in inequality and poverty
- Incidence by decile/quintile
- Concentration shares by decile/quintile
- Leakages and Coverage
- Per capita transfers
- Probit of “excluded”
- Fiscal mobility (transition) matrices

# Fiscal Incidence: Caveats

- No modeling:
  - No behavioral responses (or almost none)
  - No inter-temporal dimensions
  - No general equilibrium effects
  - No fiscal sustainability analysis
- Average Incidence

# Fiscal Incidence: Caveats

- One can never know the distribution of income that would have existed in the absence of the taxes/transfers.
- Most up-to-date and microdata-based analysis of taxes and transfers combined

Diagram 1 – Definitions of Income Concepts

# What is *Market Income*?

- Labor and nonlabor income from all sources
- Private Transfers
- Auto-consumption
- Imputed rent for owner's occupied housing
- Alimony, Inheritance and Gifts
- Contributory pensions from individualized accounts
- NO: Incomes from sales of durables
- NO: Capital Gains
- Contributory pensions from social security:
  - Benchmark: YES
  - Sensitivity Analysis: NO

# What is *Net Market Income*?

- Market Income minus Direct Taxes and Contributions to Social Security (Payroll Taxes)
- But, contributions to social security:
  - Benchmark: contributions going to pension, are NOT subtracted; all the other contributions are
  - Sensitivity Analysis: all contributions to social security are subtracted

# Construction of Income Concepts/ Calculating Taxes & Transfers

- Unfortunately, it is not possible to construct income concepts directly from household surveys
- Household Surveys in LA are quite heterogeneous:
  - Some report income and not consumption
  - Some do not report autoconsumption
  - Some do not report owner's occupied housing rent; they do not have the information to run hedonic regressions

# Construction of Income Concepts/ Calculating Taxes & Transfers

- Even more importantly:
  - Not clear if reported income is before or after taxes. SEDLAC database assumes that employees' income is net of taxes and contributions to social security and self-employment and capital incomes are before taxes and transfers
  - Not always clear if people include government transfers in the income they report (which we usually take as “market” income)

# Construction of Income Concepts/ Calculating Taxes & Transfers

- Data on direct taxes, contributions to social security, government transfers, consumption (for indirect taxes and subsidies), use of government health services may be imperfectly captured or not captured at all

| <b>Data on Direct Transfers In-Kind (e.g., food transfers)</b> | Has data on whether the household received transfers in kind, but not the amount                                | Desayuno Escolar, Program de Atención a niños y niñas menores de 6 años (PAN), Post literacy program " Yo si puedo" | No (uncommon in Brazil)                                                                                                                                                        | Yes                         | Tarjeta Uruguay Social, Comedores y merenderos      |

|                                                                                                | <a href="#">Argentina</a>                                                                           | <a href="#">Bolivia</a> | <a href="#">Brazil</a>                                                | <a href="#">Peru</a> | <a href="#">Uruguay</a> |
|------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|-------------------------|-----------------------------------------------------------------------|----------------------|-------------------------|
| <b>Data on use of public education</b>                                                         | Yes, if they attend public school                                                                   | Yes                     | Yes                                                                   | Yes                  | Yes                     |
| <b>Data on use of public health facilities</b>                                                 | Yes, if they have health insurance or they have to be attended in hospital, but not quantity of use | Yes                     | Not in POF, but yes in PNAD 2008 which we use for health calculations | Yes                  | No                      |
| <b>Data on what service was received at public health facilities</b>                           | No                                                                                                  | Yes                     | Yes in PNAD 2008                                                      | Yes                  | No                      |
| <b>Data on coverage by public health insurance schemes</b>                                     | Yes, but not quantity or which service                                                              | Yes                     | Not existent in Brazil                                                | Yes                  | Yes                     |
| <b>If none of above, what data is available on health to measure in-kind health transfers?</b> |                                                                                                     | n/a                     | --                                                                    | -                    | Public health coverage  |
| <b>Data on benefits from or use of housing and urban programs</b>                              | No, it is inferred from external sources                                                            | No                      | No                                                                    | No                   | No                      |

# Options to Construct Income Concepts

- Direct Identification Method
- Inference Method
- Imputation Method
- Alternate Survey
  
- Simulation Method
- Secondary Sources Method
  
- Appendix shows what was used in each country and for every tax and transfer

# Results: A Primer

## Declining inequality in Latin America

- Reduction in higher education premia and pro-poor government transfers
- Incidence of Taxes and Transfers

DECLINING  
INEQUALITY IN  
LATIN AMERICA

A DECADE OF PROGRESS?

LUIS F. LOPEZ-CALVA & NORA LUSTIG  
EDITORS

# Trends in Inequality

**Gini Coefficient Early 1990's-Late 2000's (Unweighted ave.)**

**Light Grey: Countries with Falling Ineq (Lustig et al., 2011)**

# Change in Gini Coefficient by Country: circa 2000-2009 (yearly change in percent)

# Comparing the Increase in the 1990's with Decline in the 2000's (Lustig et al., 2011)

# Results: A Primer

## Incidence of Taxes and Transfers

1. Lots of heterogeneity in LA
2. No clear-cut correlation between government size, the extent of redistribution, redistributive effectiveness
3. Direct taxes achieve little in the form of redistribution
4. Direct transfers reduce poverty the most when coverage of the poor is high and average transfer is close to average poverty gap
5. Indirect taxes can make poor people net contributors to the state and a substantial portion of the poor poorer

## Definitions of Income Concepts: A Stylized Presentation

# Conclusions:

First, Latin America is heterogenous;  
can't talk of "a Latin America"

The extent and effectiveness of income redistribution and poverty reduction, government size, and spending patterns vary significantly across countries.

# Heterogeneous LA: State comes in different sizes

# Decline in Gini and Effectiveness: Heterogeneous LA

# Decline in Headcount Ratio \$2.50 PPP and Pov. Reduction Effectiveness

# Conclusions

- Second, no clear-cut correlation between government size and the extent and effectiveness of redistribution and poverty reduction.

# Decline in Disp Inc Gini, Direct Transfers and Effectiveness Indicator

# Decline in Final Inc Gini, Direct Transfers and Effectiveness Indicator

# Conclusions

Third, direct taxes achieve relatively little in the form of redistribution.

Caveat:

- The rich are excluded from analysis using household surveys; need governments to share information from tax returns (anonymous of course) as all OECD countries do (except for Chile, Mexico and Turkey)

# Fiscal Policy and Decline in Gini

# Conclusions

- Fourth, large-scale targeted cash transfers can achieve significant reductions in extreme poverty.
- The extent of poverty reduction depends on:
  - size of per capita transfer (related to leakages to nonpoor)
  - coverage of the poor

# “Leakages” to Non-poor

# Coverage of the Extreme and Total Poor

# Conclusions

- Fifth, when indirect taxes are taken into account
  - The moderate poor and the near poor become net payers to the fiscal system (except for Mexico, 2008)
  - A significant share of the moderate (extreme) poor become extreme (ultra) poor in some of the countries; results for Brazil are striking

# Impact of Indirect Taxes

# Indirect Taxes and the Poor in Brazil (Lustig and Higgins, 2012)

- Indirect taxes make around 11 percent of the non-poor poor, 15 percent of the moderate poor extremely poor, and 4 percent of the extremely poor “ultra-poor” despite any cash transfers they receive
- We would have missed this with standard analysis:
  - extreme poverty and inequality indicators decline
  - overall taxes are progressive

**Table 2.** Inequality and poverty before and after taxes and transfers in Brazil

| Indicator                        | Before taxes and transfers | After taxes and transfers |
|----------------------------------|----------------------------|---------------------------|
| Gini Coefficient                 | .573                       | .539                      |
| Headcount Index <sup>1</sup>     | 5.7%                       | 4.3%                      |
| Poverty Gap <sup>1</sup>         | 2.3%                       | 1.3%                      |
| Squared Poverty Gap <sup>1</sup> | 1.3%                       | 0.6%                      |
| Headcount Index <sup>2</sup>     | 15.3%                      | 15.0%                     |
| Poverty Gap <sup>2</sup>         | 6.3%                       | 5.4%                      |
| Squared Poverty Gap <sup>2</sup> | 3.7%                       | 2.7%                      |

Note: 1: \$1.25 PPP per day; 2: \$2.50 PPP per day

Source: Pereira and Higgins (2012). Differences in poverty and the Gini between the “before” and “after” situations are all statistically significant at the 0.1% level.

# Where public *contributory* pensions go matters...

- Benchmark: *contributory* pensions are treated as market income; assumes an actuarially fair system on average
- Sensitivity Analysis: *contributory* pensions are considered as a government transfer
- Redistribution and incidence results are sensitive to the placement of contributory pensions
- Here we shall present benchmark results but show a couple of examples for the sensitivity analysis

# How sensitive are results to the placement of contributory pensions? Brazil vs. Mexico

# How sensitive to placement of contributory pensions: Uruguay incidence

Figure 4 - Changes in Income by Decile

Source: authors' calculations based on Encuesta Continua de Hogares (2009) and Nat. Accts.

Notes:

For definition of income concepts see text.

Benchmark: contributory pensions are included in market income.

Sensitivity: contributory pensions are treated as government transfers.

# Adding the top; Greater Bs. As., Argentina (Alvaredo and Piketty en López-Calva y Lustig, 2010)

**FIGURE 6**  
Gini coefficient in the Greater Buenos Aires 1980-2004

*Notes:* The black triangle denotes the Gini coefficient  $G^*$  of individual income based on the Greater Buenos Aires household survey, own calculations. Database for 1983 is missing. All results correspond to October surveys, except for 2003 (May). Only income earners with positive income were considered and no further adjustments were applied. The white triangle denotes the Gini coefficient  $G(1)AS + (1-S)G^*$ , where  $S$  is the estimate of the top 0.1% income share from Alvaredo (2010). The white diamond denotes the Gini coefficient  $G(2)AS + (1-S)G^*$ , where  $S$  is the estimate of the top 1% income share from Alvaredo (2010).

Thank you
